

Dev ops and SRE morning review

A build is a product or a result installing compiling and or assembling. Release is a build that passed all tests and a deploy is a site that has gone live.

Git hub commits are dependencies, passing tests, external libraries, frameworks.

Dev ops is running code in multiple environments should go hand in hand.

Philosophy is based on everyone working together and on the same page. Modern dev ops is centered around building infrastructure.

CI is continuous intergration and CD deploys new builds to a staging server.

CircleCI is an automation test for new code.
